## 5.20 AT+CAEMLPP eMLPP priority Registration and Interrogation

The execute command is used to change the default priority level of the user in the network. The requested priority level is checked against the eMLPP subscription of the user stored on the SIM card or in the active application in the UICC (GSM or USIM) EFeMLPP. If the user doesn't have subscription for the requested priority level an ERROR or +CME ERROR result code is returned.

The read command triggers an interrogation of the provision of the maximum priority level which the service subscriber is allowed to use and default priority level activated by the user. If the service is not provisioned, a result code including the SS-Status (?) parameter is returned.

## Example

1. Read EFSST (file\_idx= 0x6F38 , structure: transparent)

(1) Get RESPONSE first , 3~4 byte is the file size information.(e.g. 000A=10 )

at+crsm=192,28472

+CRSM: 144, 0, "0000000A6F38040015005501010000"

OK

at+crsm=176,28472,0,0,10

+CRSM: 144, 0, "FF3FFFFFFF00003C03000C"

OK

2. Read a EFADN (file\_idx= 0x6F3A , structure: Linear fixed)

(1)GET RESPONSE first , No.15 byte represents the record length (e.g 1E =30)

at+crsm=192,28474

+CRSM: 144, 0, "00001D4C6F3A04001100220502011E"

OK

(2) READ RECORD

at+crsm=178,28474,1,4,30

+CRSM: 144, 0, "00"

OK

Parameters are defined below:

Parameters	Description
<command>	176 READ BINARY 178 READ RECORD 192 GET RESPONSE 214 UPDATE BINARY 220 UPDATE RECORD 242 STATUS

<b>&lt;fileid&gt;</b>	integer type; this is the identifier of a elementary data file on SIM. <P1>, <P2>, <P3>: integer type; parameters passed on by the MT to the SIM.(For detailed information , please refer 3GPP TS11.11 Section 9.2)
<b>&lt;data&gt;</b>	information which shall be written to the SIM (hexadecimal character format; refer +CSCS)
<b>&lt;pathid&gt;</b>	string type; contains the path of an elementary file on the SIM/UICC in hexadecimal format as defined in ETSI TS 102 221 [60] (e.g. "7F205F70" in SIM and UICC case). The <pathid> shall only be used in the mode "select by path from MF" as defined in ETSI TS 102 221 [60]. NOTE: Since valid elementary file identifiers may not be unique over all valid dedicated file identifiers the <pathid> indicates the targeted UICC/SIM directory path in case of ambiguous file identifiers. For earlier versions of this specification or if <pathid> is omitted, it could be implementation specific which one will be selected. <sw1>, <sw2>: integer type; information from the SIM about the execution of the actual command.
<b>&lt;response&gt;</b>	response of a successful completion of the command previously issued (hexadecimal character format) [Note1]: READ BINARY command is used for transparent EF. READ RECORD is used for linear fixed or cyclic EF [Note2]:Before using READ BINARY, READ RECORD, UPDATE BINARY, UPDATE RECORD, please use command GET RESPONSE to get the exact length information first.

For a static address, it will be the one set by the +CGDCONT and assigned during the last PDP context activation that used the context definition referred to by <cid>. <PDP_address> is omitted if none is available.

## 7.8 AT+CGAUTO Automatic response to network request PDP context activation

The set command disables or enables an automatic positive response (auto-answer) to the receipt of a Request PDP Context Activation message from the network.

When the +CGAUTO=0 command is received, the MT shall not perform a PS detach if it is attached. Subsequently, when the MT announces a network request for PDP context activation by issuing the unsolicited result code RING or +CRING, the TE may manually accept or reject the request by issuing the +CGANS command or may simply ignore the network request.

When the +CGAUTO=1 command is received, the MT shall attempt to perform a PS attach if it is not already attached. Failure will result in ERROR or, if enabled, +CME ERROR being returned to the TE. Subsequently, when the MT announces a network request for PDP context activation by issuing the unsolicited result code RING or +CRING to the TE, this is followed by the intermediate result code CONNECT. The MT then enters V.250 online data state and follows the same procedure as it would after having received a +CGANS=1 with no <L2P> or

<cid> values specified.

Read Command	Response
<b>AT+CGAUTO?</b>	<b>+CGAUTO: &lt;n&gt;</b> <b>OK</b>

For <n> = 1 Packet Domain network requests are automatically accepted according to the description above.

## 7.9 AT+CGANS Manual response to a network request for PDP context activation

The execution command requests the MT to respond to a network request for Packet Domain PDP context activation which has been signaled to the TE by the RING or +CRING:

unsolicited result code. The <response> parameter allows the TE to accept or reject the request.

## 7.10 AT+CGCLASS GPRS mobile station class

The set command is used to set the MT to operate according to the specified GPRS mobile class. If the requested class is not supported, an ERROR or +CME ERROR response is returned. Extended error responses are enabled by the +CMEE command.

The read command returns the current GPRS mobile class.

## 7.11 AT+CGREG GPRS network registration status

The set command controls the presentation of an unsolicited result code +CGREG: <stat> when <n>=1 and there is a change in the MT's GPRS network registration status, or code +CGREG: <stat>[,<lac>,<ci>[,<Act>]] when <n>=2 and there is a change of the network cell. The read command returns the status of result code presentation and an integer <stat> which shows whether the network has currently indicated the registration of the MT. Location information elements <lac>,<ci> and <Act> are returned only when <n>=2 and MT is registered in the network.

## 8 Mobile Termination Errors

### 8.1 AT+CMEE CME ERROR configuration

Set command disables or enables the use of result code +CME ERROR: <err> as an indication of an error relating to the functionality of the MT. When enabled, MT related errors cause +CME ERROR: <err> final result code instead of the regular ERROR final result code. ERROR is returned normally when error is related to syntax, invalid parameters, or TA functionality.

Test command returns values supported as a compound value.

## 9 Annex C(27.007)

Overview of Annex AT Commands:

AT Command	Description
<b>AT+FCLASS</b>	Fax class
<b>AT+VTS</b>	DTMF tones

### 9.1 AT+FCLASS Fax class

Puts the TA in a specific mode of operation. This causes the TA to process information in a manner suitable for that type of information.

Test Command	Response
<b>AT+FCLASS=?</b>	(list of supported <n>s) <b>OK</b>
Read Command	Response
<b>AT+FCLASS?</b>	<n> <b>OK</b>
Write Command	Response
<b>AT+FCLASS=&lt;n&gt;</b>	<b>OK</b>

Parameters	Description
<n>	0 data 1 fax class 1 (TIA-578-A) 2 fax (manufacturer specific) 2.0 fax class 2 (ITU T T.32 [12] and TIA 592)

## 9.2 AT+VTS DTMF tones

Allows the transmission of DTMF tones. The command is write-only.

Note: The command is used only during voice calls.

Test Command	Response
<b>AT+VTS=?</b>	(list of supported <DTMF>s) ,(list of supported <duration>s) <b>OK</b>
Write Command	Response
<b>AT+VTS=&lt;dtmf&gt;</b>	<b>OK</b>
Reference	<p>Note</p> <p>When modem work with application (ex: WM smart phone RIL or ECMT tool) , the application expect the result of AT+VTS is returned immediately . Since user might press keypad to send DTMF very fast, so application would like to send DTMF before the previous DTMF is actually processed in NW (modem shall help to queue the DTMF request if previous is not finished yet). So we will response the result code immediately to prevent blocking the application's DTMF keypad handling.</p> <p>Currently, we only check if the digit is valid and if there is any call ongoing(ex: dialing , active exist). If yes, then we will return "OK". But please notice the "OK" doesn't imply that the DTMF is really processed successfully in NW. ex: it might fail due to MS doesn't have user connection yet. Or it might be fail due to there is no response from NW. Or it might be fail due to there is no speech channel (ex: data call) If __VTS_LATE_RESPONSE__ is turned on, "OK" is printed when SEND DTMF is acknowledged by network</p>

Parameters are defined below:

Parameters	Description
<b>&lt;DTMF&gt;</b>	<p>A single ASCII character in the set .0-9, #, *, A-D.</p> <p>For example: AT+VTS = 9 or AT+VTS = A</p> <p>You can use multiple command to achieve continuous DTMF tones.</p> <p>For example : AT+VTS=6;+VTS=2;+VTS=8;+VTS=2</p>

## 10.10 AT+CNMI New Message Indications to TE

Selects the procedure how the reception of new messages from the network is indicated to the TE when TE is active (DTR signal is ON). IF TE is inactive (DTR signal OFF), message reception is carried out as specified in GSM 03.38. This command enables the unsolicited result codes +CMT, +CMTI, +CBM, and +CDS. (Please refer to 07.07 for more detail)

If received new SMS, Ring pin will change status as below table.
